

Regulating Self-Adaptive Multi-Agent Systems with Real-Time Interventions

Wen Shen

Research Advisor: Dr. Jacob Crandall

RSC: Dr. Iyad Rahwan, Dr. Zeyar Aung

May 15th, 2013

Outline

- Background, Challenges and Objectives
- The Jiao Tong Game
- Regulating Multi-Agent Systems (MAS) with unlimited interventions
- Regulating MAS with limited interventions
- Conclusions and future work

Background

- Dynamic Resource Allocation: real-world applications, e.g.,
 - Transportation Systems
 - Building Management Systems
 - Power Grids
 - Water Supply Systems
- Existing approaches:
 - Mechanism Design
 - Approximation Algorithms
 - Machine Learning Algorithms
 - Human Supervisory Control

Challenges

- Environment:
 - highly dynamic
 - very complex
- Agents:
 - autonomous and self-interested
 - have partial information of the environment
 - reactive or adaptive to the dynamic environment
- Regulators:
 - have no or little knowledge of the decision-making process of agents
 - do not have full control over the agents
 - interventions available to influence the decision-making of the agents.

Objectives

- To better understand the general principles of human interventions in MAS.
- To investigate:
 - whether
 - under what conditions
 - to what extentpeople are able to create effective interventions.

Outline

- Background, Challenges and Objectives
- The Jiao Tong Game
- Regulating MAS with unlimited interventions
- Regulating MAS with limited interventions
- Conclusions and future work

The Jiao Tong Game

The Jiao Tong Game

- Metrics:
 - running throughput (main)
 - sliding throughput
- The agents:
 - learning agents
 - static agents
- The regulator

Outline

- Background, Challenges and Objectives
- The Jiao Tong Game
- Regulating MAS with unlimited interventions
- Regulating MAS with limited interventions
- Conclusions and future work

Regulating MAS with Unlimited Interventions

Jiao Tong

04:48

Throughput

Overall average: 9.8 veh/sec

Sliding average: 10.5 veh/sec

Toll Changes Ave: 1.33 (cents per second)

Your Score: \$ 14.89 / sec

Hypothesis 5 (Limited Interventions)

Test 5 (Limited Interventions)

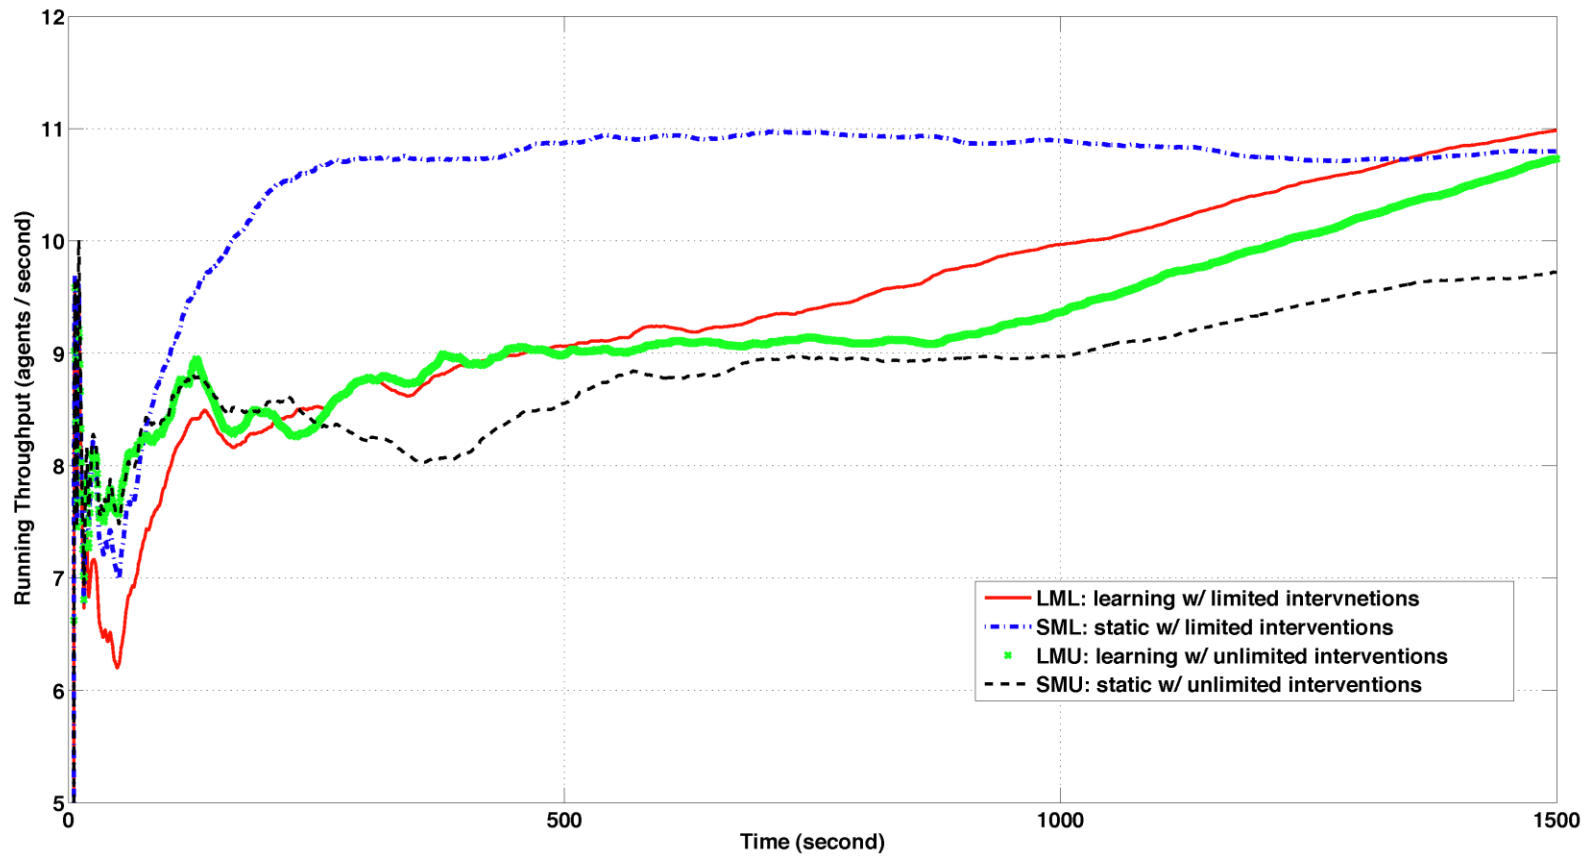

Hypothesis 6 (Limited Interventions)

Test 6 (Limited Interventions)

Running Throughput Over Time

Outline

- Background, Challenges and Objectives
- The Jiao Tong Game
- Regulating MAS with unlimited interventions
- Regulating MAS with limited interventions
- Conclusions and future work

Conclusion

- Without interventions:
 - learning > static
- With unlimited interventions:
 - static: ↑
 - learning: —
- People are better at regulating static agents than learning agents.
- With limited interventions:
 - static : short term ↑ long term —
 - learning : —

Future Work

- How to help regulators improve their understandings of agents' behavior?
- How to help them create better interventions?

Thank you!
